Amendments to the Claims:

This listing of claims will replace all prior versions, and listings, of claims in the application:

Listing of Claims:

Claim 1 (currently amended). A highly heat-resistant composite component for a fusion reactor, comprising:

a plasma-facing area made of tungsten or a tungsten alloy with a tungsten concentration of  $> 90\%$  by weight, a heat-dissipating area of copper or a copper alloy with a thermal conductivity of  $> 250\text{ W/mK}$  and a mean grain size of  $> 100\text{ }\mu\text{m}$ , and an area in between said plasma-facing area and said heat-dissipating area of a refractory-metal-copper composite;

said refractory-metal-copper composite having a macroscopically uniform copper and tungsten concentration progression and a refractory metal concentration  $x$  of  $10\text{ vol.}\% < x < 40\text{ vol.}\%$  throughout concentration  $x$  of  $60\text{ vol.}\% < x < 90\text{ vol.}\%$  throughout a thickness  $d$  of  $0.1\text{ mm} < d < 4\text{ mm}$ , and a refractory metal phase forming a virtually continuous skeleton.

Claim 2 (currently amended). The component according to claim 1, which comprises a ~~component~~ part of a metallic material having a strength of  $> 300\text{ MPa}$  at room temperature bonded to said heat-dissipating area made of copper or the copper alloy.

Claim 3 (currently amended). The component according to claim 2, wherein said ~~component part~~ consists of a Cu-Cr-Zr alloy.

Claim 4 (previously presented). The component according to claim 2, wherein said component consists of an austenitic steel.

Claim 5 (previously presented). The component according to claim 1, wherein said area between said plasma-facing area and said heat-dissipating area consists of a refractory-metal-copper composite produced with a powder-metallurgical process.

Claim 6 (previously presented). The component according to claim 5, wherein said refractory-metal-copper composite consists of tungsten and 10 to 40 vol.% copper.

Claim 7 (previously presented). The component according to claim 5, wherein said refractory metal-copper composite consists of molybdenum and 10 to 40 vol.% copper.

Claim 8 (previously presented). The component according to claim 1, wherein said plasma-facing area is a segmented structure of tungsten or a tungsten-alloy.

Claim 9 (previously presented). The component according to claim 1 in the form of a flat tile.

Claim 10 (previously presented). The component according to claim 1 in the form of a monoblock.

Claim 11 (withdrawn – currently amended). A method for producing a highly heat-resistant laminated composite flat tile component, which comprises:

bonding one or more shaped parts of tungsten or tungsten alloy with one or more plate-shaped parts of a refractory metal-copper-composite and the plate-shaped parts with an area made of copper alloy in vacuum or a non-oxidative gas atmosphere by melting the copper-containing constituents and subsequently cooling to room temperature;

joining the shaped parts to an area made of copper or a copper alloy by melting the copper-containing constituents and subsequently cooling to room temperature;

mechanically processing the resulting component; and

subsequently bonding the mechanically processed component in a form-fit with a metal component having a strength of  $> 300$  MPa in a bonding process selected from the group consisting of welding, soldering, brazing, diffusion, and a plating process to thereby produce the highly heat-resistant composite component according to claim 1.

Claim 12 (withdrawn). The method according to claim 11, which comprises bonding the shaped parts, plate-shaped parts, and the area of copper alloy in a temperature-resistant and corrosion-resistant form.

Response submitted June 22, 2006

Claim 13 (withdrawn). The method according to claim 12, wherein the temperature-resistant and corrosion-resistant form is a graphite form.

Claim 14 (withdrawn). The method according to claim 11, which comprises introducing a foil of copper or copper alloy with a thickness of 0.005 to 0.5 mm between the shaped part of tungsten or tungsten alloy and the plate-shaped part of the refractory-metal-copper composite.

Claim 15 (withdrawn). The method according to claim 14, which comprises applying a layer consisting of a ferrous metal in elemental or alloyed form to a bonding surface of one of the shaped part of tungsten or tungsten alloy, the plate-shaped part of the refractory-metal-copper composite, and the foil of copper or copper alloy.

Claim 16 (withdrawn). The method according to claim 15, wherein the ferrous metal is nickel.

Claim 17 (withdrawn). The method according to claim 11, which comprises applying a layer consisting of a ferrous metal in elemental or alloyed form to a bonding surface of one of the shaped part of tungsten or tungsten alloy and the plate-shaped part of the refractory-metal-copper composite.

Claim 18 (withdrawn). The method according to claim 17, wherein the ferrous metal is nickel.

Claim 19 (withdrawn ~ currently amended). A method for producing a highly heat-resistant monoblock component, which comprises:

bonding one or more shaped parts of tungsten or a tungsten alloy and formed with bores to one or more ring-shaped parts of a refractory metal copper-composite and the ring-shaped parts to an area consisting of copper alloy in a vacuum or inert gas atmosphere by melting the copper-containing constituents and subsequently cooling to room temperature;

bonding to an area consisting of copper or a copper alloy by melting the copper-containing constituents and subsequently cooling to room temperature;

mechanically processing the resulting component;

subsequently bonding the mechanically processed component in a form-fit with a metal component having a strength of  $> 300$  MPa in a bonding process selected from the group consisting of welding, soldering, brazing, diffusion, and a plating process to thereby produce the highly heat-resistant composite component according to claim 1.

Claim 20 (withdrawn). The method according to claim 19, which comprises bonding the shaped parts and plate-shaped parts in a temperature-resistant and corrosion-resistant form.

Claim 21 (withdrawn). The method according to claim 20, wherein the temperature-resistant and corrosion-resistant form is a graphite form.

Claim 22 (withdrawn). The method according to claim 19, which comprises introducing a foil of copper or copper alloy with a thickness of 0.005 to 0.5 mm between the shaped part of tungsten or tungsten alloy and the ring-shaped part of the refractory-metal-copper composite.

Claim 23 (withdrawn). The method according to claim 22, which comprises applying a layer consisting of a ferrous metal in elemental or alloyed form to a bonding surface of one of the shaped part of tungsten or tungsten alloy, the ring-shaped part of the refractory-metal-copper composite, and the foil of copper or copper alloy.

Claim 24 (withdrawn). The method according to claim 23, wherein the ferrous metal is nickel.

Claim 25 (withdrawn). The method according to claim 19, which comprises applying a layer consisting of a ferrous metal in elemental or alloyed form to a bonding surface of one of the shaped part of tungsten or tungsten alloy and the ring-shaped part of the refractory-metal-copper composite.

Claim 26 (withdrawn). The method according to claim 25, wherein the ferrous metal is nickel.
